# Impact of female peer composition on gender norms perceptions and skills formation in secondary school 

Martina Querejeta Rabosto

WIDER Development Conference "Reducing inequality. The great challenge of our time"
October 5, 2022 | Bogotá, Colombia

## Motivation

- The analysis of the importance of gender norms on labor market outcomes has received a great deal of academic attention.
- Gender norms comprehend behavioral expectations according to gender. (Pearse \& Connell, 2016; Seguino, 2007)
- Norms may become an obstacle to girl's educational achievements and future economic outcomes. (Fortin, 2005; Bertrand, 2020)
- Pioneer theoretical frameworks based on human capital factors explain a decreasing portion of gender gaps. (Blau \& Kahn, 2017; Goldin, 2014)
- Emerging literature points to gender norms and stereotypes that could lead to persistent gender inequality. (Bertrand, 2020)

## Motivation

- How gender norms perceptions are formed and what drives its changes over time are still open questions.
- Norms formation process involves many actors. School and peers increasingly important with age.
- Peer gender composition might affect perceptions on gender norms by at least two channels.
- Affect social attitudes and behaviors between groups due to diversity in class composition. (Rao, 2019)
- Affect interaction between teachers and students promoting the transmission of gender views. (Carlana, 2019; Alan, Ertac \& Mumcu, 2018)

## Research question and contribution

## ¿How gender composition in secondary school affects students’ perceptions on gender norms?

## Contribution to peer effects literature.

- Evidence for developed countries is well-established. (Epple \& Romano, 2011; Sacerdote, 2011; Paloyo, 2020)
- Literature in developing contexts is scarcer - data requirements. (Izaguirre \& Di Capua, 2020; Balsa, Gandelman \& Roldán, 2018; McEwan, 2003)
- Even for developed countries literature addressing gendered impacts is still scarce. (Hoxby, 2000; Lavy \& Schlosser, 2011; Gong, Lu \& Song, 2019)
- Effects on skill formation have been widely studied, little is known about the transmission of gender norms within school contexts. (Angrist \& Lang, 2004; Ammermueller \& Pischke, 2009; Lavy \& Schlosser, 2011; Brenøe \& Zölitz, 2020)

## Research question and contribution

## Contribution to gender norms literature.

- The effects of gender norms on economic outcomes has been widely studied. (Vella, 1994; Fortin, 2005; Bertrand, 2020)
- Literature on how are they formed and what drives its changes over time is still scarce.
- Family transmission. (Farré \& Vella, 2013)
- From teachers to students. (Alan et al., 2018; Carlana, 2019)
- Only one related work analyzing the school peer effects on gender norms for the Vietnamese case. (Garcia-Brazales, 2021)

## Contribution to public policies.

- Long-term effects at the individual level affecting educational outcomes, career choices and labor outcomes. (Sahoo \& Klasen, 2018)
- Effects at the social level by misallocating talents that will affect economic growth. (Hsieh, Hurst, Jones \& Klenow, 2019)

## Institutional context

- Mandatory basic education in Uruguay includes 14 years of formal schooling.
- At 12 years of age students enter secondary education (7th to 12 th grade).
- Admission to public secondary school based mainly on geographic criteria.
- When opting for a private secondary school, can choose school without external restrictions.
- The assignment of students to classrooms is made by the heads of the school.
- Students are (re)assigned to classes every year at the beginning of the school year (March) and share all curricular activities throughout the year.
- Peer interaction is intense but short.

## Data

- Uruguayan survey for evaluation of the educational system (Aristas).
- Representative of 9th grade secondary students attending urban schools.
- Novel sampling design: (i) Schools randomly selected, (ii) Classes randomly selected, (iii) All students within classes are interviewed.
- October 2018.

## Estimation sample

- Students from public and private regular secondary schools.
- Non-missing information in the analyzed variables.
- Classes with more than 12 students.
- Schools with two or more classes.
- $60.3 \%$ of original sample. Sample selection

## Main descriptives

Table: Descriptive statistics by sex

|  | Males |  | Females |  |
| :--- | :---: | :---: | :---: | :---: |
|  | Mean | SD | Mean | SD |
| Student characteristics |  |  |  |  |
| Age | 14.90 | 1.49 | 14.78 | 1.12 |
| Only child | 0.25 | 0.44 | 0.23 | 0.42 |
| Live w/both parents | 0.69 | 0.46 | 0.68 | 0.47 |
| Live w/grandparents | 0.18 | 0.38 | 0.15 | 0.35 |
| 40\% lower SE | 0.33 | 0.47 | 0.39 | 0.49 |
| Age above median | 0.16 | 0.37 | 0.12 | 0.32 |
| Previous repetition     <br> Main independent variable 0.26 0.44 0.20 0.40 <br> Share female 0.52 0.10 0.51 0.09 <br> Observations 2547  2790  |  |  |  |  |

## Gender norms descriptives

Figure: Students' views on gender norms, by sex

## Empirical Strategy

Linear-in means model:

$$
\begin{equation*}
y_{i c s}=\alpha+\beta_{1} \text { ShareFem }_{i c s}+\beta_{2} X_{i c s}+\beta_{3} \bar{X}_{i c s}+\lambda_{s}+\epsilon_{i c s} \tag{1}
\end{equation*}
$$

- ShareFem ${ }_{i c s}$ leave-one-out proportion of female peers in the class.
- $X_{i c s}\left(\bar{X}_{i c s}\right)$ vector of student control variables (peers).
- $\lambda_{s}$ school-level fixed effects.
- $\epsilon_{i c s}$ standard errors clustered at the class level.

The empirical strategy exploits the quasi-random variation in the percentage of female peers across classrooms within school for the identification of causal effects.

## Validity of the identification strategy

- School level fixed-effects.
- Assignment of students to classes as-good-as random.
- Random simulation of students to classes Simulation
- Balance test of student characteristics by proportion of female peers
- Variation in share of female peers among classes within schools

## Main results

## Table: Effects of the proportion of female peers on gender norms

|  | Gender norms | Employment | Wages | Politics | Domestic work | Care work | Sports |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Share female | $0.384^{*}$ | $0.470^{* *}$ | $-0.495^{*}$ | $0.542^{* * *}$ | $0.723^{* * *}$ | $0.478^{* *}$ | -0.139 |
|  | $(0.23)$ | $(0.22)$ | $(0.30)$ | $(0.19)$ | $(0.21)$ | $(0.24)$ | $(0.24)$ |
| Female | -0.003 | 0.013 | -0.021 | 0.002 | 0.014 | 0.001 | -0.022 |
|  | $(0.03)$ | $(0.03)$ | $(0.03)$ | $(0.03)$ | $(0.03)$ | $(0.03)$ | $(0.03)$ |
| Obs. | 5337 | 5337 | 5337 | 5337 | 5337 | 5337 | 5337 |
| R-squared | 0.110 | 0.083 | 0.062 | 0.070 | 0.087 | 0.073 | 0.061 |

Notes: The table shows the results of regressing each outcome variable on the share of female peers in the group, student and peers characteristics controls, and school fixed effects. Robust standard errors clustered at class level reported in parentheses. ***significant at the $1 \%$ level, ${ }^{* *} 5 \%$ level, ${ }^{*} 10 \%$ level. The sample includes students from public and private regular secondary schools, with non-missing information in analyzed variables, in classes with more than 12 students, and in schools with two or more classes. Sample drawn from Aristas's survey, INEEd.

## Heterogeneous effects: by sex

> Table: Effects of the proportion of female peers on gender norms, by students' sex

|  | Employment | Wages | Politics | Domestic work | Care work | Sports | Gender norms |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Panel A: Male students |  |  |  |  |  |  |  |
| Share female | $0.648^{* *}$ | $-0.828^{* *}$ | $0.907^{* * *}$ | $0.846^{* * *}$ | $0.770^{* *}$ | $-0.677^{* *}$ | 0.405 |
|  | $(0.29)$ | $(0.41)$ | $(0.27)$ | $(0.27)$ | $(0.33)$ | $(0.30)$ | $(0.32)$ |
| Obs. | 2547 | 2547 | 2547 | 2547 | 2547 | 2547 | 2547 |
| R-squared | 0.106 | 0.099 | 0.117 | 0.122 | 0.093 | 0.102 | 0.136 |
| Panel B: Female students |  |  |  |  |  |  |  |
| Share female | 0.326 | -0.337 | 0.139 | $0.634^{* *}$ | 0.186 | 0.116 | 0.259 |

| Observations | 1021 | 4316 | 1772 | 3565 | 1258 | 3451 | 1371 | 3966 |
| $R^{2}$ | 0.206 | 0.101 | 0.162 | 0.110 | 0.178 | 0.127 | 0.121 | 0.123 |

Notes: The table shows the results of regressing the gender norms index on the share of female peers in the group, student and peers characteristics controls, and school fixed effects separately by student's predetermined characteristics. Robust standard errors clustered at class level reported in parentheses. ${ }^{* * *}$ significant at the $1 \%$ level, ${ }^{* * 5} \%$ level, ${ }^{*} 10 \%$ level. The sample includes students from public and private regular secondary schools, with non-missing information in analyzed variables, in classes with more than 12 students, and in schools with two or more classes. Sample drawn from Aristas's survey, INEEd.

## Further outcomes: time use

## Table: Effects of the proportion of female peers on gendered behaviours, by students' sex

|  | Cooking | Clothing | Cleaning | Caring | Index |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Panel A: Male students |  |  |  |  |  |
| Share female | -0.182 | 0.204 | -0.074 | 0.154 | 0.035 |
|  | $(0.25)$ | $(0.29)$ | $(0.25)$ | $(0.25)$ | $(0.27)$ |
| Obs. | 2538 | 2538 | 2538 | 2538 | 2538 |
| R-squared | 0.093 | 0.102 | 0.094 | 0.132 | 0.114 |
| Panel B: Female students |  |  |  |  |  |
| Share female | -0.436 | -0.111 | -0.301 | $-0.601^{*}$ | $-0.499^{*}$ |
|  | $(0.27)$ | $(0.25)$ | $(0.29)$ | $(0.31)$ | $(0.28)$ |
| Obs. | 2782 | 2782 | 2782 | 2782 | 2782 |
| R-squared | 0.095 | 0.133 | 0.146 | 0.143 | 0.161 |

Notes: The table shows the results of regressing each outcome variable on the share of female peers in the group, student and peers characteristics controls, and school fixed effects separately by student's predetermined characteristics. Standardized values for the ordered response on frequency the student helps (i) Cooking for the family; (ii) Washing of clothes; (iii) House cleaning; (vi) Caring for siblings or other family members. Robust standard errors clustered at class level reported in parentheses. ${ }^{* * *}$ significant at the $1 \%$ level, $* * 5 \%$ level, $* 10 \%$ level. The sample includes students from public and private regular secondary schools, with non-missing information in analyzed variables, in classes with more than 12 students, and in schools with two or more classes. Sample drawn from Aristas's survey, INEEd.

## Further outcomes: cognitive skills

Table: Effects of the proportion of female peers on cognitive skills, by sex

|  | Male |  |  | Female |  |
| :--- | :---: | :---: | :---: | :---: | :---: |
|  | Mathematics | Language |  | Mathematics | Language |
| Share female | 0.194 | -0.098 |  | $0.460^{*}$ | 0.064 |
|  | $(0.33)$ | $(0.29)$ |  | $(0.27)$ | $(0.40)$ |
| Obs. | 2416 | 2381 |  | 2640 | 2571 |
| R-squared | 0.310 | 0.226 |  | 0.321 | 0.285 |

Notes: The table shows the results of regressing Mathematics and Language standarized scores on the share of female peers in the group, student and peers characteristics controls, and school fixed effects separately by student's own gender. Robust standard errors clustered at class level reported in parentheses. ${ }^{* * *}$ significant at the $1 \%$ level, ${ }^{* *} 5 \%$ level, ${ }^{*} 10 \%$ level. The sample includes students from public and private regular secondary schools, with non-missing information in analyzed variables, in classes with more than 12 students, and in schools with two or more classes. Sample drawn from Aristas's survey, INEEd.

## Robustness checks

- Teacher and class controls
- Sample attrition
- Probability of random assignment

Random

- Dropping schools one by one Schools

## Conclusions

- This paper investigates how gender composition in secondary school affects students' perceptions on gender norms in the Uruguay context.
- Robust significant and positive effects of higher exposure to female peers.
- Reduction of traditional gender norms perceptions.
- Effects mostly driven by male students and low socioeconomic background.
- Changing actual behavior.
- Reduction in domestic work assumed by female students.
- Improvement in academic math performance for female students.
- Even short interactions in secondary school (one year) may have substantial effects in reducing gender stereotyped perceptions and behaviors among students.

## Thank you!

| $R^{2}$ | 0.061 | 0.061 | 0.056 | 0.064 |

Notes: The table shows the results of regressing a dummy variable indicating missing value in the outcome variable on student gender, the share of female peers in the group and school fixed effects. Robust standard errors clustered at class level reported in parentheses. $* * *$ significant at the $1 \%$ level, ${ }^{* * 5} \%$ level, ${ }^{*} 10 \%$ level. The sample includes students from public and private regular secondary schools, with non-missing information in analyzed variables, in classes with more than 12 students, and in schools with two or more classes. Sample drawn from Aristas's survey, INEEd.

## Table: Robustness check: Missing control variables treatment

|  | Gender norms |
| :--- | :---: |
| Share female | $0.379^{*}$ |
|  | $(0.23)$ |
| Female | -0.000 |
|  | $(0.03)$ |
| Observations | 5342 |
| $R^{2}$ | 0.113 |

Notes: The table shows the results of regressing each outcome variable on the share of female peers in the group, student and peers characteristics controls (imputed when missing), school fixed effects, and dummy variables indicating missing value in the control variables. Robust standard errors clustered at class level reported in parentheses. ${ }^{* * *}$ significant at the $1 \%$ level, ${ }^{* * 5 \%}$ level, ${ }^{*} 10 \%$ level. Sample drawn from Aristas's survey, INEEd.

Table: Robustness check: Further test to randomization

|  | Gender norms | Employment | Wages | Politics | Domestic work | Care work | Sports |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Share female | 0.359 | $0.550^{*}$ | $-0.657^{*}$ | $0.545^{* *}$ | $0.669^{* * *}$ | $0.708^{* *}$ | -0.338 |
|  | $(0.28)$ | $(0.31)$ | $(0.36)$ | $(0.23)$ | $(0.25)$ | $(0.28)$ | $(0.26)$ |
| Female | 0.001 | 0.024 | -0.027 | 0.006 | 0.020 | 0.012 | -0.029 |
|  | $(0.04)$ | $(0.04)$ | $(0.04)$ | $(0.04)$ | $(0.04)$ | $(0.04)$ | $(0.04)$ |
| Obs. | 4223 | 4223 | 4223 | 4223 | 4223 | 4223 | 4223 |
| R-squared | 0.119 | 0.083 | 0.069 | 0.070 | 0.093 | 0.080 | 0.065 |

Notes: The table shows the results of regressing the gender norm index on the share of female peers in the group, student and peers characteristics controls, and school fixed effects for the sub-sample of schools with grater probability of random assignment of students to classes. Robust standard errors clustered at class level reported in parentheses. ${ }^{* * *}$ significant at the $1 \%$ level, **5\% level, *10\% level. Sample drawn from Aristas's survey, INEEd.

Figure: Robustness check: Distribution of estimates after randomly dropping schools.

Notes: The figure shows the distribution of the coefficient associated to the share of female peers from 9,180 regressions that each time randomly drop two schools from the main sample. Regression of the gender norm index on the share of female peers in the group, student and peers characteristics controls, and school fixed effects. The sample includes students from public and private regular secondary schools, with non-missing information in analyzed variables, in classes with more than 12 students, and in schools with two or more classes. Sample drawn from Aristas's survey, INEEd.
